The following symbols stand for the specified modules:

1. FORWARD

SIEMENS

The module B4 is assigned content wise to Additional functions of STEP 7- Programming.

Learning goal:

In this module, the reader should learn how a data block can be used to save data.

- Generating data blocks
- Specifying a structure of a data block
- Access to a data element in a STEP 7- Program

Requirements:

For the successful use of this module, the following knowledge is assumed:

- Knowledge in the use of Windows 95/98/2000/ME/NT4.0
- Basics of PLC- Programming with STEP 7 (e.g. Module A3 'Startup' PLC programming with STEP 7)
- Basics to structured programming (e.g. Appendix I Basics to PLC Programming with SIMATIC S7-300)

Forwaru

Notes

Required hardware and software

- 1 PC, Operating system Windows 95/98/2000/ME/NT4.0 with
 - Minimal: 133MHz and 64MB RAM, approx. 65 MB free hard disk space
 - Optimal: 500MHz and 128MB RAM, approx. 65 MB free hard disk space
- 2 Software STEP 7 V 5.x
- 3 MPI- Interface for the PC (e.g. PC- Adapter)
- 4 PLC SIMATIC S7-300 with at least one digital in- and output module. The inputs must be lead through a functional unit.

Example configuration:

- Power supply: PS 307 2A
- CPU: CPU 314
- Digital input: DI 16x DC24V
- Digital output: DO 16x DC24V / 0.5 A

Forward

2. NOTES FOR DATA BLOCKS

Data Blocks (DBs) can be used by your program to save data in the CPU. Your hard disk contains up to 8 KBytes (8192 Bytes) space.

There are two types of data blocks. **Global** DBs, where all OBs, FBs and FCs read all saved data or can even write in the DB and **local instance** DBs, which are assigned a particular FB. In the DBs, different data types (e.g. BOOL or WORD) can be saved in arbitrary order. This structuring of a DB follows through input in a table with the tool **LAD, STL,FBD - S7 Block Programming**.

In the program structure from STEP 7, data blocks are found as follows:

Forward	Notes	Generating data blocks	
TIA Training document	Page 6 of 18		Modu

3. GENERATING DATA BLOCKS

i

Data blocks are generated and opened like program blocks in the tool **LAD,STL,FBD: Program blocks**. They serve e.g. for the saving of data and system states.

In the following text, the generation of a simple example is described by the use of a global data block:

Thereby values should be chosen with the switches 'S0' to 'S7' and displayed on an output module 'Display'. Thereby one has more switches by activation, where the representation of the value to switch S7 has the highest priority and the representation of the value to switch S1 has the lowest.

The example relates to the displayed addresses below:

Inputs:

- Switch S0 = I 0.0
- Switch S1 = I 0.1
- Switch S2 = I 0.2
- Switch S3 = I 0.3
- Switch S4 = I 0.4
- Switch S5 = I 0.5
- Switch S6 = I 0.6
- Switch S7 = I 0.7

Outputs:

- Display = QW4

Forward

In order to generate this program example, the following steps must be followed (Thereby the program is dispensed with the creation of the hardware configuration):

1. Call **SIMATIC Manager** with a double click (\rightarrow SIMATIC Manager)

2. Create a new project (\rightarrow File \rightarrow New)

PLC View Options Window Help	-

operations.).

If the data block is assigned as a local instance DB to a FB, the declarations table of the FB declares the structure of the DB.

Notes

i

Data in a data block must be determined through data types.

The following standard- data types are defined in the S7 below :

Type and	Size	Format-Options	Range and number notation	Example
description	in Bits		(lowest to highest values)	
BOOL (Bit)	1	Boolean text	TRUE/FALSE	TRUE
BYTE (Byte)	8	Hexadecimal number	B#16#0 to B#16#FF	B#16#10
WORD (Word)	16	Binary number	2#0 to 2#1111_1111_1111_1111	2#0001_0000_0000_0000
		Hexadecimal number	W#16#0 to W#16#FFFF	W#16#1000
		BCD	C#0 to C#999	C#998
		Decimal number unsigned	B#(0,0) to B#(255,255)	B#(10,20)
DWORD (Double word)	32	Binary number	2#0 to 2#1111_1111_1111_1111_1111_1111 _1111_1111	2#1000_0001_0001_1000_1 011_1011_0111_1111
		Hexadecimal number	DW#16#0000_0000 to DW#16#FFF_FFF	DW#16#00A2_1234
		Decimal number unsigned	B#(0,0,0,0) to B#(255,255,255,255)	B#(1,14,100,120)
INT (Integer)	16	Decimal number signed	-32768 to 32767	1
DINT (Int,32 bit)	32	Decimal number signed	L#-2147483648 to L#2147483647	L#1
REAL (Floating- point number)	32	IEEE floating-point number	Upper limit: +/-3.402823e+38 Lower limit: +/-1.175495e-38	1.234567e+13
S5TIME (Simatic-Time)	16	S7-Time in steps of 10 ms	S5T#0H_0M_0S_10MS to S5T#2H_46M_30S_0MS and S5T#0H_0M_0S_0MS	S5T#0H_1M_0S_0MS S5TIME#1H_1M_0S_0MS
TIME (IEC-Date)	32	IEC-Time in steps from 1ms, integer signed	-T#24D_20H_31M_23S_648MS to T#24D_20H_31M_23S_647MS	T#0D_1H_1M_0S_0MS TIME#0D_1H_1M_0S_0MS
DATE (IEC-Date)	16	IEC-Date in steps of 1 day	D#1990-1-1 to D#2168-12-31	DATE#1994-3-15
TIME_OF_DAY (Time)	32	Time in steps of 1ms	TOD#0:0:0.0 to TOD#23:59:59.999	TIME_OF_DAY#1:10:3.3
CHAR (Character)	8	ASCII-Characters	´Α´, ´B´ etc.	'B'

Values should be modified in a data block. It is not adequate to modify them in the field Initial value. This is only possible, when one switches to the Data View under View (→ View → Data View).

Forward	Notes	Generating data blocks

ľ

There are three possibilities to access the data:

1. Direct address access:

One can access one data element in a data block with the following instructions:

Example:

L	DB 20. DBB2	Load data byte 2 from DB20 into ACCU 1
L	DB 22. DBW4	Load data word 4 from DB22 into ACCU 1
А	DB 2. DBX5.6	Carry out an AND- logical operation with data bit 5.6 from DB2.

2. Access to the data elements in the already opened data blocks:

In order to be able to access a data element over several data elements, the DB must first be opened with the instructions OPN DB or OPN DI. Then several data bits (DBX/DIX),data bytes (DBB/DIB), data words (DBW/DIW) or data double words (DBD/DID) can be processed in digital or binary operations.

In doing so, one especially uses OPN DI for the opening of instance DBs. It can also be used for global DBs, when 2 DBs remain open at the same time.

Examp	le:	
OPN	DB 20	Opening of DB20
OPN	DI 22	Opening of DB22
L	DBW 0	Download data word 0 from DB20 into AKKU 1
Т	MW 1	Transfer the contents from ACCU 1 to memory bit 1
A	DIX 0.0	AND- Operation from data bit 0.0 to DB22 with
A	l 1.0	input bit 1.0
=	Q 4.0	Assignment of the result to output bit 4.0

3. Access to data out of local instance DBs by call with the function block:

Data can be transferred by the call of the corresponding instance data block with the instruction CALL FB1, DB19. The assignment of the variables that would be defined in the declarations table of the FB and whose value stands in the DB, take place directly in the absolute address (e.g. IW0, M 10.0 or QW4) with the CALL instruction.

Example:		
CALL	FB1, DB19	
COUNT:=	IW 0	The variable COUNT is assigned to IW 0 as an absolute address.
OUT:=	Q 4.0	The variable OUT is assigned to Q4.0 as an absolute address.

The format of the variables and the assigned absolute address must be equal.

Note:

15. With LAD, STL, FBD: Program blocks, you now have an editor that give you the possibility to generate your STEP 7-Program.

The schema for the selection of the data element through the button is shown for the first three inputs as specified below.

If the organization block OB1 is not generated for all switches S0 to S7, it should be saved

and downloaded into the PLC \square . The mode switch of the CPU must be on STOP! (\rightarrow \square \rightarrow
